

Surgery Tables

We designed our Surgery Tables with input from veterinary surgeons in order to improve veterinary practice. Basic features are height regulation, top inclination and top tilting. These features ensure the conditions for keeping the patients in the best location and position.

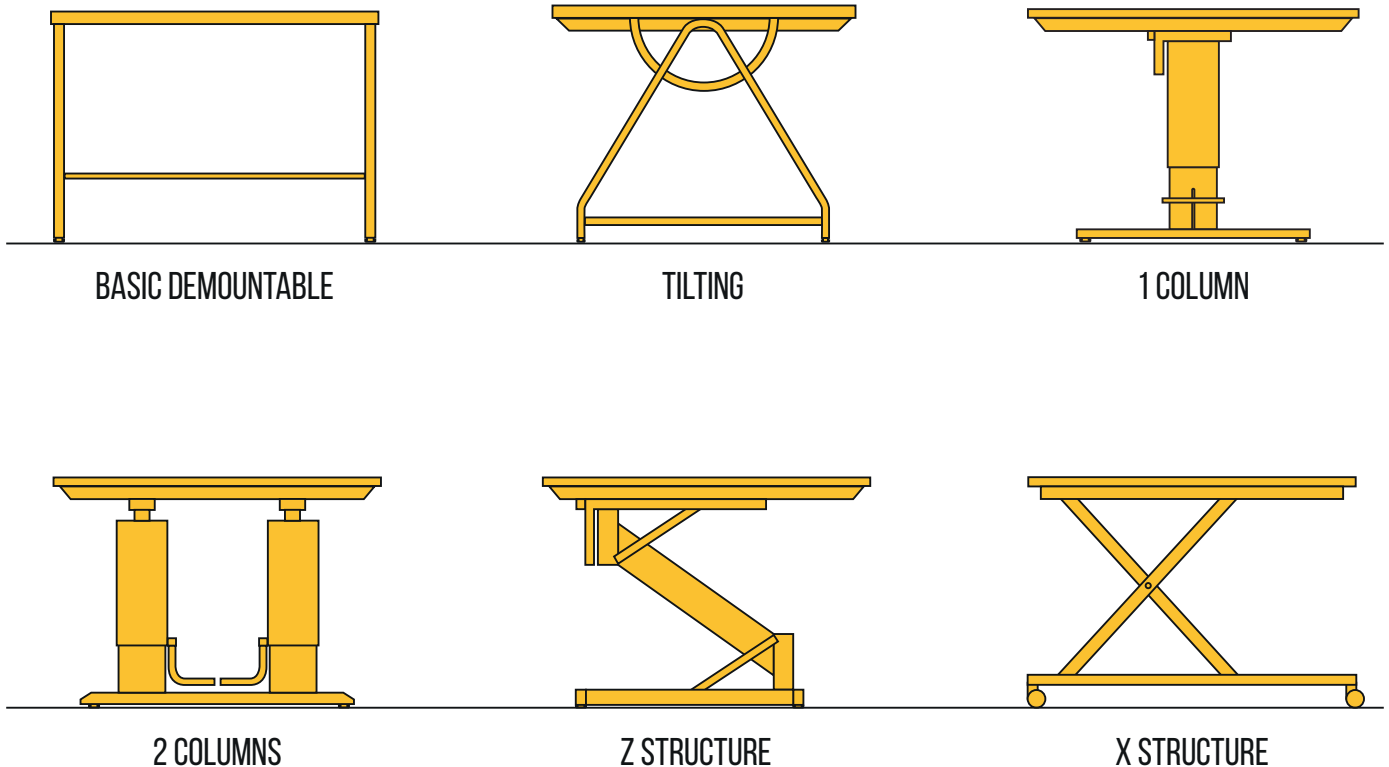

Our range of Surgery Tables include fixed structures and well as adjustable solutions, in height, position or both. There are options for Hydraulic manual and also Electric operation.

Tops are made entirely of AISI304 stainless steel, an excellent material given its resistance, durability and easily cleanable. It is also an inert material (does not react with any substance with which it contacts) and nontoxic

(does not provoke intoxications). They may be flat or V shaped, allowing for independent flap adjustment. The structures may be also be made of AISI304 satinless steel or lacquered iron.

Lubb has Surgery Tables with several configurations, from the basic to the most complete, suited to any need: height regulation (hydraulic or electric), top's tilting regulation and even the regulation of the top's flaps to help maintaining the animal in the desired position.

All Surgery Tables have a slight slope to channel debris, preventing their accumulation. There are accessories that further increase the functionality of the tables, as serum bottle supports.
